

Introduction to Cryptography

Chapter 1: Cryptology overview

Manuel

Summer 2017

Outline

- ① A first glimpse at cryptology
- ② Classical cryptology
- ③ Modern cryptology

Are you following the right course?

Cryptology

A brief history of cryptology

Early times

Cryptology is an old science:

- Earliest known use of cryptography: 1500 BC (Mesopotamia)
- Common among Hebrews scholars from 500 BC
- Greeks used it as well as some form of steganography
- Romans are known to have used cryptography
- Arabs were the first to document cryptanalysis methods

A brief history of cryptology

Early times

Cryptology is an old science:

- Earliest known use of cryptography: 1500 BC (Mesopotamia)
- Common among Hebrews scholars from 500 BC
- Greeks used it as well as some form of steganography
- Romans are known to have used cryptography
- Arabs were the first to document cryptanalysis methods

Advantage was on the side of cryptanalysts

A brief history of cryptology

Until World War II

No major advances until World War I

- Cryptography gained popularity in the 19th century
- During World War I UK broke German naval encryption
- 1917: invention of an unbreakable cipher
- Introduction of mathematics in cryptography
- Development of electromechanical devices to encrypt/decrypt
- Huge advances (on both sides) during World War II

A brief history of cryptology

Modern times

Mathematics becomes the heart of cryptography:

- 1949: Shannon defines two goals for cryptography: secrecy and authenticity
- 1976: Diffie and Hellman introduce public key cryptography
- 1990s: internet and e-commerce require encryption
- Today: cryptography is everywhere

A brief history of cryptology

Modern times

Mathematics becomes the heart of cryptography:

- 1949: Shannon defines two goals for cryptography: secrecy and authenticity
- 1976: Diffie and Hellman introduce public key cryptography
- 1990s: internet and e-commerce require encryption
- Today: cryptography is everywhere

Many politics tried to kill cryptography such that governments can hold the monopoly

Basic communication scenario

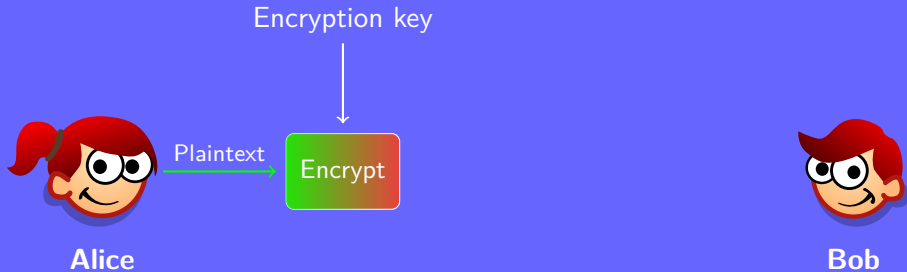

Alice

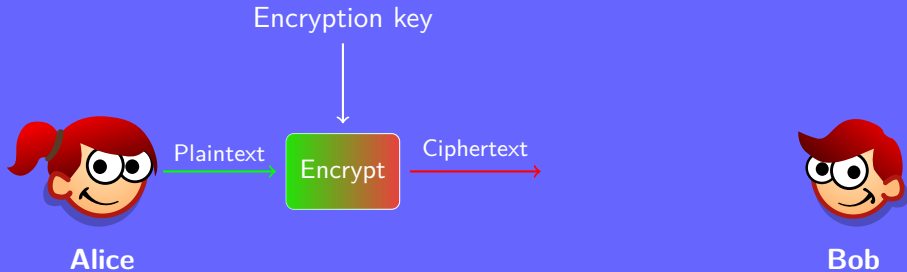

Bob

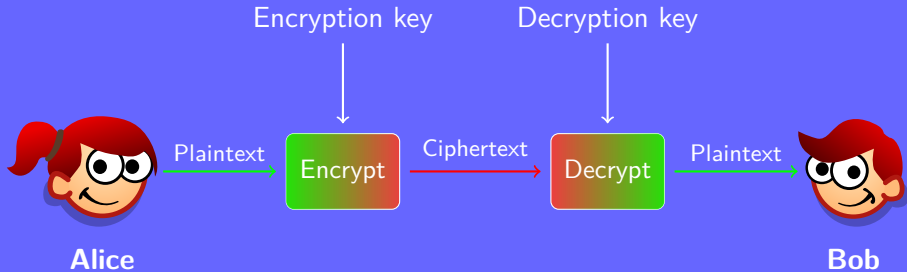

Basic communication scenario

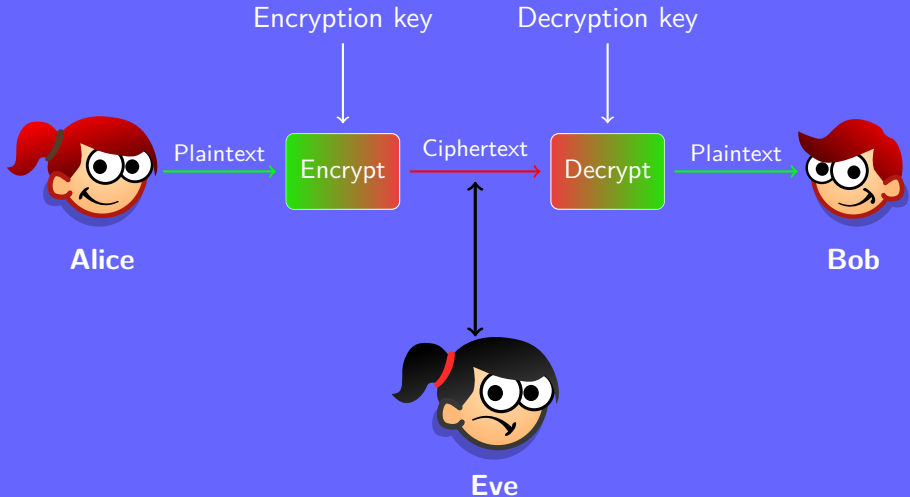

Basic communication scenario

Basic communication scenario

Basic communication scenario

Eve's goals

Eve has one of the following goals:

- Read a message
- Find the key
- Corrupt Alice's message
- Masquerade as Alice

Eve's strategies

Theory

There are the five main types of attacks:

- **Ciphertext only:** Eve only has a copy of the ciphertext
- **Known Plaintext Attack (KPA):** Eve has a copy of the ciphertext but also of the corresponding plaintext
- **Chosen Plaintext Attack (CPA):** Eve chooses the plaintext to be encrypted
- **Chosen Ciphertext Attack (CCA):** Eve chooses the ciphertext to be decrypted
- **Chosen Plaintext and Ciphertext Attack (CPCA):** Eve chooses any plaintext to be encrypted or ciphertext to be decrypted

Eve's strategies

Practice

A CRYPTO NERD'S IMAGINATION:

HIS LAPTOP'S ENCRYPTED.
LET'S BUILD A MILLION-DOLLAR
CLUSTER TO CRACK IT.

NO GOOD! IT'S
4096-BIT RSA!

BLAST! OUR
EVIL PLAN
IS FOILED!

WHAT WOULD ACTUALLY HAPPEN:

HIS LAPTOP'S ENCRYPTED.
DRUG HIM AND HIT HIM WITH
THIS \$5 WRENCH UNTIL
HE TELLS US THE PASSWORD.

GOT IT.

Eve's strategies

Practice

Methods to collect data:

- On fiber cables and infrastructures as the flow passes
- From the servers of service providers

Methods to retrieve encrypted data:

- Break the encryption
- Influence industrial standards
- Pressure manufacturers to make insecure devices
- Infiltrate hardware and software

Who is Eve and why is she evil?

Eve is anyone that might want to read or temper the data:

- **Low threat:** friends, family members etc. . .
- **High threat:** governmental agencies and companies

Who is Eve and why is she evil?

Eve is anyone that might want to read or temper the data:

- **Low threat:** friends, family members etc. . .
- **High threat:** governmental agencies and companies

Reasons for mass surveillance:

- Combat terrorism
- Assess foreign policies and economical stability
- Gather commercial secrets

Why fear Eve?

What does your phone know about you?

Why fear Eve?

What does your phone know about you?

“They (the NSA) can use the system to go back in time and scrutinize every decision you’ve ever made, every friend you’ve ever discussed something with, and attack you on that basis to sort of derive suspicion from an innocent life and paint anyone in the context of a wrongdoer.”

Edward Snowden

Kerckhoffs' principle

Principle (Kerckhoffs' principle)

A cryptosystem should be secure even if everything about the system, except the key, is public knowledge.

Kerckhoffs' principle

Principle (Kerckhoffs' principle)

A cryptosystem should be secure even if everything about the system, except the key, is public knowledge.

Said otherwise: security through obscurity is not security

Going even further: data should be encrypted using standard, publicly known algorithms

Outline

- ① A first glimpse at cryptology
- ② Classical cryptology
- ③ Modern cryptology

Caesar cipher

- One of the earliest cipher
- Attributed to Julius Caesar
- Letters are shifted by a given number of places
- The shift is called the *key* of the cipher

Caesar cipher

- One of the earliest cipher
- Attributed to Julius Caesar
- Letters are shifted by a given number of places
- The shift is called the *key* of the cipher

Recover the plaintext given the ciphertext JRRGPRUQLQJ

Modular arithmetic

Definitions

- ① Let a and b be two integers, with $a \neq 0$. We say that a *divides* b if there exists an integer k such that $b = ak$, and we denote it $a|b$.
- ② Let a , b and n be three integers with $n \neq 0$. We say that a *is congruent to b modulo n* , if n divides $a - b$. It is denoted $a \equiv b \pmod{n}$

Modular arithmetic

Definitions

- ① Let a and b be two integers, with $a \neq 0$. We say that a *divides* b if there exists an integer k such that $b = ak$, and we denote it $a|b$.
- ② Let a , b and n be three integers with $n \neq 0$. We say that a *is congruent to b modulo n* , if n divides $a - b$. It is denoted $a \equiv b \pmod{n}$

In modern cryptography:

- The plaintext is first converted into a numerical value
- If the alphabet is composed of n symbols then each one is assigned a value between 0 and $n - 1$

Revisiting Caesar cipher

- 1 Label letters as integers from 0 to 25
- 2 Choose a key κ in the range $0 - 25$
- 3 Encrypt using the function $x \mapsto x + \kappa \bmod 26$
- 4 Decrypt using the function $x \mapsto x - \kappa \bmod 26$
- 5 Label integers from 0 to 25 as letters

Revisiting Caesar cipher

- 1 Label letters as integers from 0 to 25
- 2 Choose a key κ in the range $0 - 25$
- 3 Encrypt using the function $x \mapsto x + \kappa \bmod 26$
- 4 Decrypt using the function $x \mapsto x - \kappa \bmod 26$
- 5 Label integers from 0 to 25 as letters

Exercise.

Encrypt and decrypt “students are working hard” using Caesar cipher with the key $\kappa = -5$

Breaking Caesar cipher

Using the different types of attacks:

- **Ciphertext only:**

Breaking Caesar cipher

Using the different types of attacks:

- **Ciphertext only:** only 26 possible keys \Rightarrow exhaustive search
- **KPA:**

Breaking Caesar cipher

Using the different types of attacks:

- **Ciphertext only:** only 26 possible keys \Rightarrow exhaustive search
- **KPA:** deduce the key from the plaintext/ciphertext pair
- **CPA:**

Breaking Caesar cipher

Using the different types of attacks:

- **Ciphertext only:** only 26 possible keys \Rightarrow exhaustive search
- **KPA:** deduce the key from the plaintext/ciphertext pair
- **CPA:** for the plaintext “a”, the ciphertext gives κ
- **CCA:**

Breaking Caesar cipher

Using the different types of attacks:

- **Ciphertext only:** only 26 possible keys \Rightarrow exhaustive search
- **KPA:** deduce the key from the plaintext/ciphertext pair
- **CPA:** for the plaintext “a”, the ciphertext gives κ
- **CCA:** for the ciphertext “A”, the plaintext gives $-\kappa \bmod 26$

Substitution ciphers

1776, Thomas Jefferson sends a message to Benjamin Franklin:

Your job is to decipher it

Letters distribution in English

Decrypting the message

Monograms

For the 10 most common letters their count gives

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| W | B | R | S | I | V | A | P | N | O |
| 76 | 64 | 39 | 36 | 36 | 35 | 34 | 32 | 30 | 16 |

Decrypting the message

Monograms

For the 10 most common letters their count gives

| | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|
| W | B | R | S | I | V | A | P | N | O |
| 76 | 64 | 39 | 36 | 36 | 35 | 34 | 32 | 30 | 16 |

Conclusion:

- W is probably e
- B, R, S, I, V, A, P, and N are probably t, a, o, i, n, s, h, and r
- In what order?

Decrypting the message

Digrams

Digrams count

| | W | B | R | S | I | V | A | P | N |
|---|----|----|----|----|---|----|----|---|----|
| W | 3 | 4 | 12 | 2 | 4 | 10 | 14 | 3 | 1 |
| B | 4 | 4 | 0 | 11 | 5 | 5 | 2 | 4 | 20 |
| R | 5 | 5 | 0 | 1 | 1 | 5 | 0 | 3 | 0 |
| S | 1 | 0 | 5 | 0 | 1 | 3 | 5 | 2 | 0 |
| I | 1 | 8 | 10 | 1 | 0 | 2 | 3 | 0 | 0 |
| V | 8 | 10 | 0 | 0 | 2 | 2 | 0 | 3 | 1 |
| A | 7 | 3 | 4 | 2 | 5 | 4 | 0 | 1 | 0 |
| P | 0 | 8 | 6 | 0 | 1 | 1 | 4 | 0 | 0 |
| N | 14 | 3 | 0 | 1 | 1 | 1 | 0 | 7 | 0 |

Rules in English

- e contacts most of other letters
- a, i, o tend to avoid each other
- 80% of the letters preceding n are vowels
- the most common digram is th
- h often appears before e, rarely after
- r pairs more with vowels and s with consonants
- rn more common than nr and to than ot

Completing the decryption

One Time Pad

Using the One Time Pad:

- ① Represent the message as a sequence of 0s and 1s of length l
- ② Generate a key of length l and composed of 0s and 1s
- ③ XOR the message and the key

One Time Pad

Using the One Time Pad:

- 1 Represent the message as a sequence of 0s and 1s of length l
- 2 Generate a key of length l and composed of 0s and 1s
- 3 XOR the message and the key

Breaking the One Time Pad:

- **Ciphertext only:** all the messages of same length have equal probability
- **KPA, CPA, CCA:** only reveal part of the key used during the attack

Hill cipher

Block cipher: encrypt a whole block of several letters at once

Consequence:

- Changing one letter in the plaintext impacts several letters in the ciphertext
- Frequency analysis of letters and digrams cannot be applied

Hill cipher

Block cipher: encrypt a whole block of several letters at once

Consequence:

- Changing one letter in the plaintext impacts several letters in the ciphertext
- Frequency analysis of letters and digrams cannot be applied

Hill cipher:

- Invented in 1929
- One of the first cipher to use algebraic methods
- Never been used much in practice

Algebraic digression

Greatest common divisor

Definition

The *greatest common divisor* of two integers a and b , with $|a| + |b| \neq 0$, is the largest positive integer dividing both a and b . It is noted $\gcd(a, b)$, and a and b are said to be *coprime* if $\gcd(a, b) = 1$.

In fact $\gcd(a, b)$ can be expressed as a linear combination of a and b with integer coefficients.

Lemma (Bézout's identity)

Let a and b be two integers where at least one of them is not zero, and $d = \gcd(a, b)$. Then there exists two integers s and t , called *Bézout coefficients*, such that $as + bt = d$.

Algebraic digression

Computing the gcd

Algorithm. (*Extended Euclidean Algorithm*)

Input : a, b , two positive integers

Output: $r_1 = \gcd(a, b)$ and $\langle s_1, t_1 \rangle$, Bézout coefficients

```
1  $r_0 \leftarrow b; r_1 \leftarrow a;$ 
2  $s_0 \leftarrow 0; s_1 \leftarrow 1;$ 
3  $t_0 \leftarrow 1; t_1 \leftarrow 0;$ 
4 while  $r \neq 0$  do
5    $q \leftarrow r_1 \operatorname{div} r_0;$ 
6    $\langle r_1, r_0 \rangle \leftarrow \langle r_0, r_1 - qr_0 \rangle;$ 
7    $\langle s_1, s_0 \rangle \leftarrow \langle s_0, s_1 - qs_0 \rangle;$ 
8    $\langle t_1, t_0 \rangle \leftarrow \langle t_0, t_1 - qt_0 \rangle;$ 
9 end while
10 return  $r_1, \langle s_1, t_1 \rangle$ 
```

Algebraic digression

Multiplicative inverse

Proposition

Let a and n be two coprime integers and s and t be such that $as + nt = 1$. Then $as \equiv 1 \pmod{n}$, and s is called the *multiplicative inverse* of a modulo n . Besides s is unique.

Example.

What is the multiplicative inverse of 11111 modulo 12345?

Algebraic digression

Multiplicative inverse

Proposition

Let a and n be two coprime integers and s and t be such that $as + nt = 1$. Then $as \equiv 1 \pmod{n}$, and s is called the *multiplicative inverse* of a modulo n . Besides s is unique.

Example.

What is the multiplicative inverse of 11111 modulo 12345?

Running the extended Euclidean algorithm confirms that 11111 and 12345 are coprime and therefore 11111 is invertible modulo 12345. Moreover since

$$11111 \cdot 2471 + 12345 \cdot (-2224) = 1,$$

we conclude that $11111 \cdot 2471 \equiv 1 \pmod{12345}$.

Algebraic digression

Matrix inversion

Theorem (Cramer's rule)

Let A be an $m \times m$ matrix, then

$$\text{Adj}(A) \cdot A = \det(A) I_m, \quad (1.1)$$

where $\text{Adj}(A)$ denotes the adjugate of A , $\det(A)$ the determinant of A , and I_m the $m \times m$ identity matrix.

From equation (1.1) we see that for A to be invertible, $\det(A)$ must be invertible. In particular if A is defined modulo n , $\det(A)$ must be invertible modulo n , that is there exists t such that

$$\det(A) \cdot t \equiv 1 \pmod{n}.$$

Algebraic digression

Modular matrix inversion

Example.

Compute the inverse of the matrix

$$A = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 4 & 9 \end{pmatrix} \bmod 11.$$

Algebraic digression

Modular matrix inversion

Example.

Compute the inverse of the matrix

$$A = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 2 & 3 \\ 1 & 4 & 9 \end{pmatrix} \bmod 11.$$

Since $\det(A) = 2$ and $\gcd(2, 11) = 1$, A is invertible modulo 11 and

$$A^{-1} = \frac{1}{2} \left(\begin{array}{c|c|c} + & \begin{vmatrix} 2 & 3 \\ 4 & 9 \end{vmatrix} & - & \begin{vmatrix} 1 & 1 \\ 4 & 9 \end{vmatrix} & + & \begin{vmatrix} 1 & 1 \\ 2 & 3 \end{vmatrix} \\ \hline - & \begin{vmatrix} 1 & 3 \\ 1 & 9 \end{vmatrix} & + & \begin{vmatrix} 1 & 1 \\ 1 & 9 \end{vmatrix} & - & \begin{vmatrix} 1 & 1 \\ 1 & 3 \end{vmatrix} \\ \hline + & \begin{vmatrix} 1 & 2 \\ 1 & 4 \end{vmatrix} & - & \begin{vmatrix} 1 & 1 \\ 1 & 4 \end{vmatrix} & + & \begin{vmatrix} 1 & 1 \\ 1 & 2 \end{vmatrix} \end{array} \right) \bmod 11.$$

Algebraic digression

Modular matrix inversion

Then calculating all the cofactors yields

$$A^{-1} = \frac{1}{2} \begin{pmatrix} 6 & -5 & 1 \\ -6 & 8 & -2 \\ 2 & -3 & 1 \end{pmatrix} \text{ mod } 11.$$

In this case it is easy to see that 6 is the inverse of 2 modulo 11, such that we get

$$A^{-1} = \begin{pmatrix} 36 & -30 & 6 \\ -36 & 48 & -12 \\ 12 & -18 & 6 \end{pmatrix} \equiv \begin{pmatrix} 3 & 3 & 6 \\ 8 & 4 & 10 \\ 1 & 4 & 6 \end{pmatrix} \text{ mod } 11.$$

Back to Hill cipher

- **Key:** generate a random $n \times n$ matrix K modulo 26, with $\gcd(\det(K), 26) = 1$
- **Encrypt:**
 - Split the plaintext into blocks of size n , padding with extra letters if necessary
 - Multiply each block considered as a vector by the matrix K
- **Decrypt:**
 - Split the ciphertext into blocks of size n
 - Multiply each block considered as a vector by the matrix K^{-1}

Hill cipher

Example.

Encrypt “good morning” with the key $K = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 9 & 7 & 8 \end{pmatrix}$.

Hill cipher

Example.

Encrypt “good morning” with the key $K = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 9 & 7 & 8 \end{pmatrix}$.

- 1 Split and pad the plaintext

| | | | | | | | | | | | |
|---|----|----|---|----|----|----|----|---|----|---|----|
| g | o | o | d | m | o | r | n | i | n | g | x |
| 6 | 14 | 14 | 3 | 12 | 14 | 17 | 13 | 8 | 13 | 6 | 23 |
| A | | | B | | | C | | | D | | |

- 2 Multiply each vector by K

Hill cipher

Example.

Encrypt “good morning” with the key $K = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 9 & 7 & 8 \end{pmatrix}$.

- 1 Split and pad the plaintext

| | | | | | | | | | | | |
|---|----|----|---|----|----|----|----|---|----|---|----|
| g | o | o | d | m | o | r | n | i | n | g | x |
| 6 | 14 | 14 | 3 | 12 | 14 | 17 | 13 | 8 | 13 | 6 | 23 |
| A | | | B | | | C | | | D | | |

- 2 Multiply each vector by K

| | | | | | | | | | | | |
|----|----|---|----|---|----|----|----|----|----|---|----|
| A' | | | B' | | | C' | | | D' | | |
| 6 | 24 | 6 | 21 | 8 | 11 | 11 | 25 | 11 | 10 | 9 | 25 |
| G | Y | G | V | I | L | L | Z | L | K | J | Z |

KPA on Hill cipher

Knowing “goodmorningx” and “GYGVILLZLKJZ” recover the key.

KPA on Hill cipher

Knowing “goodmorningx” and “GYGVILLZLKJZ” recover the key.

- 1 Find n : since $n|12$, try some values until the right one is found

KPA on Hill cipher

Knowing “goodmorningx” and “GYGVILLZLKJZ” recover the key.

- 1 Find n : since $n|12$, try some values until the right one is found
- 2 Use the three first blocks to construct the equation

$$\underbrace{\begin{pmatrix} 6 & 14 & 14 \\ 3 & 12 & 14 \\ 17 & 13 & 8 \end{pmatrix}}_A \cdot \begin{pmatrix} a & b & c \\ d & e & f \\ g & h & i \end{pmatrix} \equiv \begin{pmatrix} 6 & 24 & 6 \\ 21 & 8 & 11 \\ 11 & 25 & 11 \end{pmatrix} \pmod{26}$$

KPA on Hill cipher

Knowing “goodmorningx” and “GYGVILLZLKJZ” recover the key.

- 1 Find n : since $n|12$, try some values until the right one is found
- 2 Use the three first blocks to construct the equation

$$\underbrace{\begin{pmatrix} 6 & 14 & 14 \\ 3 & 12 & 14 \\ 17 & 13 & 8 \end{pmatrix}}_A \cdot \begin{pmatrix} a & b & c \\ d & e & f \\ g & h & i \end{pmatrix} \equiv \begin{pmatrix} 6 & 24 & 6 \\ 21 & 8 & 11 \\ 11 & 25 & 11 \end{pmatrix} \pmod{26}$$

- 3 Since A is not invertible modulo 26, try with the three last blocks

$$\underbrace{\begin{pmatrix} 3 & 12 & 14 \\ 17 & 13 & 8 \\ 13 & 6 & 23 \end{pmatrix}}_A \cdot \begin{pmatrix} a & b & c \\ d & e & f \\ g & h & i \end{pmatrix} \equiv \begin{pmatrix} 21 & 8 & 11 \\ 11 & 25 & 11 \\ 10 & 9 & 25 \end{pmatrix} \pmod{26}$$

KPA on Hill cipher

- ④ Since A is now invertible we calculate

$$K = \begin{pmatrix} a & b & c \\ d & e & f \\ g & h & i \end{pmatrix} \equiv \begin{pmatrix} 3 & 12 & 14 \\ 17 & 13 & 8 \\ 13 & 6 & 23 \end{pmatrix}^{-1} \cdot \begin{pmatrix} 21 & 8 & 11 \\ 11 & 25 & 11 \\ 10 & 9 & 25 \end{pmatrix} \pmod{26}$$

$$K = \begin{pmatrix} a & b & c \\ d & e & f \\ g & h & i \end{pmatrix} \equiv \begin{pmatrix} 11 & 18 & 4 \\ 7 & 11 & 10 \\ 1 & 22 & 11 \end{pmatrix} \cdot \begin{pmatrix} 21 & 8 & 11 \\ 11 & 25 & 11 \\ 10 & 9 & 25 \end{pmatrix} \pmod{26}$$

KPA on Hill cipher

- ④ Since A is now invertible we calculate

$$K = \begin{pmatrix} a & b & c \\ d & e & f \\ g & h & i \end{pmatrix} \equiv \begin{pmatrix} 3 & 12 & 14 \\ 17 & 13 & 8 \\ 13 & 6 & 23 \end{pmatrix}^{-1} \cdot \begin{pmatrix} 21 & 8 & 11 \\ 11 & 25 & 11 \\ 10 & 9 & 25 \end{pmatrix} \pmod{26}$$

$$K = \begin{pmatrix} a & b & c \\ d & e & f \\ g & h & i \end{pmatrix} \equiv \begin{pmatrix} 11 & 18 & 4 \\ 7 & 11 & 10 \\ 1 & 22 & 11 \end{pmatrix} \cdot \begin{pmatrix} 21 & 8 & 11 \\ 11 & 25 & 11 \\ 10 & 9 & 25 \end{pmatrix} \pmod{26}$$

And the key is

$$K = \begin{pmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 9 & 7 & 8 \end{pmatrix}.$$

Hill cipher

Remarks

- In a substitution cipher, changing one letter from the plaintext alters one letter from the ciphertext
- In Hill cipher changing one letter from the plaintext alters the whole corresponding block from the ciphertext
- Hill cipher is not vulnerable to frequency analysis attacks
- As a drawback a small error in the transmission can induce a major error in the encrypted message and the deciphered text becomes unreadable

The Enigma machine

- Developed in Germany during the 1920s
- 1054560 ways to initialise the machine
- 100391791500 ways to interchange six pairs of letters
- Secretly broken in Poland in the 1930s
- Techniques extended by the British during World War II

Outline

- ① A first glimpse at cryptology
- ② Classical cryptology
- ③ Modern cryptology

Symmetric vs. Asymmetric

All the previous schemes are symmetric:

- The same key is used to both encrypt and decrypt
- The decryption key is easily derived from the encryption key

Symmetric vs. Asymmetric

All the previous schemes are symmetric:

- The same key is used to both encrypt and decrypt
- The decryption key is easily derived from the encryption key

Limitations:

- Alice and Bob need to meet in order to exchange, generate, or share the secret keys
- Key management problem:
 - 2 users \rightarrow 1 key
 - 5 users \rightarrow 4 keys each, total 10 keys
 - n users $\rightarrow n - 1$ keys each, total $O(n^2)$ keys

Implementing public key cryptography

Key idea: anybody can lock the padlock but only Bob can unlock it

Implementing public key cryptography

Key idea: anybody can lock the padlock but only Bob can unlock it

Mathematical problems used in Public Key Cryptography (PKC):

- Easy to generate by anybody
- Hard to solve for everybody
- Easy to solve when knowing a small secret

Implementing public key cryptography

Key idea: anybody can lock the padlock but only Bob can unlock it

Mathematical problems used in Public Key Cryptography (PKC):

- Easy to generate by anybody
- Hard to solve for everybody
- Easy to solve when knowing a small secret

Common examples:

- Multiplication and factorisation
- Exponentiation and discrete logarithm problem

Historical progression

Over time security has depended on:

- **Early years:** keeping the encryption method secret
- **After WW I:** keeping the secret key unknown
- **Modern cryptography:**
 - The method, the encryption key, and how to find the secret key are known
 - Security depends on the computational infeasibility of finding it

Historical progression

Over time security has depended on:

- **Early years:** keeping the encryption method secret
- **After WW I:** keeping the secret key unknown
- **Modern cryptography:**
 - The method, the encryption key, and how to find the secret key are known
 - Security depends on the computational infeasibility of finding it

PKC adds much flexibility at a high computational cost

Measuring security

Key space

Obvious strategy to find the secret key: brute force attack

Intuition: the larger the key space the harder finding the key

Measuring security

Key space

Obvious strategy to find the secret key: brute force attack

Intuition: the larger the key space the harder finding the key

Example.

Substitution cipher:

- Key space: $26! \approx 4 \cdot 10^{26} \approx 2^{89}$
- Very simple to break using frequency analysis

Measuring security

Key space

Obvious strategy to find the secret key: brute force attack

Intuition: the larger the key space the harder finding the key

Example.

Substitution cipher:

- Key space: $26! \approx 4 \cdot 10^{26} \approx 2^{89}$
- Very simple to break using frequency analysis

Brute force is to be used only if no other attack is possible

Measuring security

Computational complexity

Best CPUs available in 2015:

- Regular user: 298,190 MIPS (Intel Core i7 5960x)
- Supercomputer: 10,000,000,000 MIPS (Fujitsu K – 705,024 cores)

How many such computers need to run for a year to complete a program composed of 2^{80} instructions?

Measuring security

Computational complexity

Best CPUs available in 2015:

- Supercomputer: 10,000,000,000 MIPS (Fujitsu K – 705,024 cores)

How many such computers need to run for a year to complete a program composed of 2^{80} instructions?

Complexity and security

Goal: be secure in the worst case

In the worst case the attacker:

- Has the best computational facilities
- Uses the most efficient attack available

Complexity and security

Goal: be secure in the worst case

In the worst case the attacker:

- Has the best computational facilities
- Uses the most efficient attack available

To be secure against such an attacker:

- Check to complexity of the best algorithm available
- Adjust the parameters of the cipher such that more than 2^{128} operations are required to break the encryption

Complexity and security

Example

Example.

Assuming that the best attack on a mathematical problem requires \sqrt{n} operations, where n is the size of the key, what key size should be chosen to be secure?

Since secure means that the attacker has to compute at least 2^{128} operations to break the encryption it suffices to calculate

$$\left(2^{128}\right)^2 = 2^{256}.$$

Hence the key space should contain 2^{256} elements, that is the key should be at least 256 bits long.

Improving security?

Does double encryption with two different keys enhance security?

Improving security?

Does double encryption with two different keys enhance security?

Naive answer: if k is the keysize then 2^{2k} operations are needed

Improving security?

Does double encryption with two different keys enhance security?

Naive answer: if k is the keysize then 2^{2k} operations are needed

Better answer:

- It does not change anything (e.g. Hill cipher)
- It is possible to do better than 2^{2k} : meet in the middle attack

Improving security?

Does double encryption with two different keys enhance security?

Naive answer: if k is the keysize then 2^{2k} operations are needed

Better answer:

- It does not change anything (e.g. Hill cipher)
- It is possible to do better than 2^{2k} : meet in the middle attack

Symmetric encryption using a function f and a key k :

- Simple encryption: $c = f_k(m)$
- Double encryption: $c = f_{k_2}(f_{k_1}(m))$
- Decryption: $m = f_{k_1}^{-1}(f_{k_2}^{-1}(c))$

Meet in the middle attack

Assuming a KPA setup:

- ① For all the keys, compute and store the ciphertexts $c_i = f_{k_i}(m)$
- ② Compute all plaintexts $m_i = f_{k_i}^{-1}(c)$ and find any matching c_i
- ③ Recover the corresponding keys k_1 and k_2
- ④ Test k_1 and k_2 on more plaintext/ciphertext pairs

Meet in the middle attack

Assuming a KPA setup:

- ① For all the keys, compute and store the ciphertexts $c_i = f_{k_i}(m)$
- ② Compute all plaintexts $m_i = f_{k_i}^{-1}(c)$ and find any matching c_i
- ③ Recover the corresponding keys k_1 and k_2
- ④ Test k_1 and k_2 on more plaintext/ciphertext pairs

Exercise.

Assuming no attack applies on an encryption scheme and a key size of 64 bits, what is its security if applying double encryption?

Complexity theory

Main complexity classes related to cryptology:

- \mathcal{P} : decision problems for which there exists a deterministic polynomial time algorithm
- \mathcal{NP} : decision problems for which the answer “yes” can be verified using a deterministic polynomial time algorithm
- \mathcal{NP} -complete: hardest problems in \mathcal{NP}
- $\text{co-}\mathcal{NP}$: decision problems for which the answer “no” can be verified using a deterministic polynomial time algorithm
- $\text{co-}\mathcal{NP}$ -complete: hardest problems in $\text{co-}\mathcal{NP}$

Complexity theory

Example

Example.

Integer factorization is in both \mathcal{NP} and $\text{co-}\mathcal{NP}$

Let n be a large integer and $1 < m < n$. Does n have a factor p , with $1 < p < m$?

- \mathcal{NP} : with certificate “ p a factor of n ” verify in polynomial time that $1 < p < m$ and $p|n$
- $\text{co-}\mathcal{NP}$: with certificate “the list of all the prime factors of n ” verify in polynomial time that:
 - They are all prime
 - Their product is n
 - None of them is between 1 and m

Zero knowledge proofs

Bob knows a secret path, and wants to prove it without revealing it

- 1 Alice hides while Bob choses to go Left (L) or Right (R)
- 2 Alice randomly asks Bob to exit on L or R
- 3 If Bob is on the wrong side he uses the secret path or otherwise returns

Zero knowledge proofs

Bob knows a secret path, and wants to prove it without revealing it

- ① Alice hides while Bob choses to go Left (L) or Right (R)
- ② Alice randomly asks Bob to exit on L or R
- ③ If Bob is on the wrong side he uses the secret path or otherwise returns
- ④ Repeat steps 1 to 3 many times

Mathematical digression

Graphs

Definitions

- ① Let $G_1 = (V_1, E_1)$ and $G_2 = (V_2, E_2)$ be two simple graphs. Then we say that G_1 and G_2 are *isomorphic* if there exists a bijective function $\varphi: V_1 \rightarrow V_2$ such that the induced map

$$\varphi_*: E_1 \rightarrow E_2, \quad (a, b) \mapsto (\varphi(a), \varphi(b))$$

is bijective. Such a function φ is called a *graph isomorphism*.

- ② A *Hamilton circuit* in a graph G is a simple circuit that passes through every vertex of G exactly once.

Complexity digression

Graphs

Hard problems related to graph theory:

- Graph isomorphism:
 - No known polynomial time algorithm
 - Not proven to be \mathcal{NP} -complete
 - Best known algorithm has exponential complexity
- Finding a Hamiltonian circuit:
 - Proven to be \mathcal{NP} -complete
 - Best known algorithm has exponential complexity

Zero knowledge proofs

Authentication

Initial setup:

- A graph G
- A Hamiltonian circuit in G

- Bob's graph G

Zero knowledge proofs

Authentication

Initial setup:

- A graph G
- A Hamiltonian circuit in G

- Bob's graph G

Process:

- 1 Bob generates H , a graph isomorphic to G
- 2 Bob commits H
- 3 Alice randomly asks for either the isomorphism or a Hamiltonian circuit in H
- 4 Bob either shows the isomorphism or translates the Hamiltonian circuit in G onto H and shows it

Zero knowledge proofs

Questions

Regarding the process and setup:

- Is Bob revealing any sensitive information?
- Why does Bob commit H ?
- Why is Alice randomly asking for H or a Hamiltonian circuit?
- Can Bob or Alice cheat?
- How many times should the process be repeated for Bob to prove that he really knows a Hamiltonian circuit in G ?

Key points
