Ex. 1 — RSA setup

1. In the RSA encryption and decryption, we use

$$ed \equiv 1 \bmod \varphi(n)$$

$$m^{ed} \equiv m \bmod \varphi(n)$$

This is based on the Euler's theorem, which has a condition that m and n be two coprime integers. So it is likely for n to be coprime with m.

2. Suppose $k = a\varphi(n)$, $a \in N^*$, and $m < n$.

(a)

$$\begin{aligned} m^k &\equiv (m^{\varphi(n)})^a \bmod n \\ &\equiv 1^a \bmod n \\ &\equiv 1 \bmod n \end{aligned}$$

So

$$m^k \equiv 1 \bmod p \quad \text{and} \quad m^k \equiv 1 \bmod q$$

(b) First, if $\gcd(m, n) = 1$, according to (a), it's obvious that

$$m^{k+1} \equiv m \bmod p \quad \text{and} \quad m^{k+1} \equiv m \bmod q$$

Second, if $\gcd(m, n) = p$, so $\gcd(m/p, q) = 1$

$$\begin{aligned} m^{k+1} &\equiv p \left[\left(\frac{m}{p} \right)^{k+1} \bmod q \right] \bmod n \\ &\equiv p \left[\left(\frac{m}{p} \right)^{a(p-1)\varphi(q)+1} \bmod q \right] \bmod n \\ &\equiv p \cdot \frac{m}{p} \bmod n \\ &\equiv m \bmod n \end{aligned}$$

So

$$m^{k+1} \equiv m \bmod p \quad \text{and} \quad m^{k+1} \equiv m \bmod q$$

Third, if $\gcd(m, n) = q$, it is similar to the second case.
We can conclude that for any arbitrary m, $m^{k+1} \equiv m \bmod p$ and mod q.

3. (a) We know that $ed \equiv 1 \bmod \varphi(n)$, which means that $ed = k+1$ where k is a multiple of $\varphi(n)$. According to part 2(b), we know that for any arbitrary m, $m^{k+1} \equiv m \bmod p$ and mod q, or we can say $m^{k+1} \equiv m \bmod n$, so $m^{ed} \equiv m \bmod n$,

   (b) From the previous calculation, we can find that for all $m < n$, no matter m and n are coprime or not, we can both find that $m^{ed} \equiv m \bmod n$, so that the RSA encryption and decryption can be performed. So we can conclude that it is not necessary that $\gcd(m, n) = 1$.

Ex. 2 — RSA decryption

$$n = 11413 = 101 \times 113$$

So we can find that $p = 101$ and $q = 113$, and we should calculate d so that $ed \equiv 1 \bmod n$.

$$m \equiv c^d \bmod n$$

Ex. 3 — Breaking RSA

Ex. 4 — Programming

Ex. 5 — Simple Questions

1.
2.
3.
4.
5.

$$(97-1) = 96 = 2^5 \times 3$$

So the generator x should satisfy that

$$x^{32} \neq 1 \bmod 97 \quad \text{and} \quad x^{48} \neq 1 \bmod 97$$

$$x^{16} \neq \pm 1, 35, 61 \bmod 97$$

We can find that

$$\begin{aligned} 2^{16} &\equiv 61 \bmod 97 \\ 3^{16} &\equiv 61 \bmod 97 \\ 4^{16} &\equiv 1 \bmod 97 \\ 5^{16} &\equiv 36 \bmod 97 \end{aligned}$$

So the smallest generator of $U(Z/97Z)$ is 5.
